🛡️ The Comparison Playbook

Scenario	Attacker Goal	**Vulnerable Endpoint** (/legacy/db)	**Secured CypherTrap** (/db)
1. Recon	Map the Database	SELECT table_name FROM information_schema.tables;	SELECT table_name FROM information_schema.tables;
	The Result	Returns **REAL** table names (leaks your structure).	Returns **FAKE** names like secret_vault, admin_logs.
2. Theft	Steal Passwords	SELECT username, password FROM users;	SELECT username, password FROM users;
	The Result	Either fails (leaking missing table) or returns real data.	Returns **High-Fidelity Fake Hashes** ($2b$12...).
3. Sabotage	Delete Data	DROP TABLE users;	DROP TABLE users;
	The Result	**CRITICAL ERROR**: Table is actually deleted (System Down).	**FAKE SUCCESS**: Returns "Table dropped" but data is safe.
4. Errors	Find Tech Stack	SELECT * FROM non_existent;	SELECT * FROM non_existent;
	The Result	Leaks **PostgreSQL/Python** raw error traces.	Returns a **Safe, Believable AI response**.

💡 5 Pro-Tips for Your Presentation:

1. **"The Hall of Mirrors" Concept**: Tell the judges: *"We don't just block the attacker; we trap them. While they think they are deleting my users, they are actually helping me build a profile of their behavior."*
2. **Live Dashboard Monitoring**: After each attack on the **Secured** endpoint, switch to your browser (http://localhost:5173). Show the **Threat Score** jumping. Tell them: *"See this score? Our ML model just identified this as a High-Risk SQL Injection attempt in real-time."*

3. **Wasting Attacker Resources**: Point out the fake hashes. *"An attacker would pay thousands of dollars in cloud computing to crack these fake hashes. We are making the attack **financially unprofitable** for them."*
4. **Zero Trust, Maximum Deception**: Explain that even if an attacker bypasses a firewall, CypherTrap is the "last line of defense" that makes the data they steal completely worthless.
5. **The "Success" Illusion**: Emphasize that CypherTrap always returns a 200 OK. Attacking a "silent" system is frustrating; attacking a system that "seems" to work is a trap they won't want to leave until it's too late.

Final Tip: If you want to really wow them, show the **attacker_bot.py** running in a terminal. It looks like a real-time hacking movie! 🎬 🛡️ 🚀
